LITERATURE SURVEY

<ul style="list-style-type: none"> • Phishing Detection 	<p>This project surveys the literature on the detection of phishing attacks. Phishing links can be identifies using some features extracted from the URL link and further phishing can be avoided</p>	<ul style="list-style-type: none"> • Classifiers Model Based features 	<ul style="list-style-type: none"> • Phish-Net <p>Comments: Expands blacklisted URLs (parents) and produces multiple variations of the same URL (children) via heuristics, thus it analyses data parts only.</p>	<p>Advantage: High level of accuracy, create new type of features like Markov features.</p> <p>Disadvantage: Huge number of features, many algorithm for classification which mean time consuming.</p>

LITERATURE SURVEY

Web phishing detection using AIWL	This paper proposes that the phishing weblinks can be identified through extracting features and data theft can be prevented using ML algorithms.	<ul style="list-style-type: none">• Clustering of phishing email	<ul style="list-style-type: none">• AIWL <p>Comment: Classification accuracy is highly dependent on the individual user.</p>	<p>Advantage: Fast in classification process.</p> <p>Disadvantage: Less accuracy because it depend on unsupervised learning, need feed continuously.</p>
